

human: I have a runny nose

ai: Okay, I can help you with that. To get a better understanding of your situation, could you tell me if you have any other symptoms besides a runny nose, such as congestion, sneezing, or a cough?

human: sneezing

ai: Okay, thanks for letting me know you're also sneezing. To help me narrow down the possibilities, how long have you been experiencing the runny nose and sneezing?

human: 2 days

ai: Thanks for letting me know. Have you noticed if your nasal discharge is clear, or is it colored (yellow, green, or any other color)?

human: reen

ai: Okay, thanks for letting me know it's green. A green nasal discharge, along with a runny nose and sneezing, could indicate a possible infection, such as a cold or sinusitis. To help me understand your situation better, have you experienced any facial pain or pressure?

human: no

ai: Okay, thanks for letting me know you don't have any facial pain or pressure. Have you taken any medication for your symptoms?

human: no

ai: Okay, thanks for letting me know you have not taken any medication for your symptoms. Since you have a green nasal discharge, runny nose, and sneezing for the past two days, and you're not experiencing any facial pain or pressure, it still could be a cold or another upper respiratory infection. To gather a bit more information, have you had a fever or chills?
